

OraVital® Gum Disease Treatment/Therapy

Bacteria In Your Mouth Can Cause Oral Infections

Research shows that 75% of the population suffers from some form of periodontal disease. Dental hygiene cleanings alone will not eliminate harmful, infectious oral bacteria. If you have other risk factors such as diabetes, heart disease, poor nutrition, taking medications, moderate to high stress, or you are a smoker, these increase the potential for disease to progress quickly.

Bleeding Gums Are Never Normal And Should Be Taken Seriously.

Gum disease bacteria attack your gums, resulting in inflammation, bleeding gums, bad breath, and even the loss of teeth. The loss of just one tooth due to periodontal (gum) disease can actually decrease your life expectancy.

In addition to the damage created in your mouth, harmful bacteria can enter your blood stream and attack other organs in your body. This is why periodontal and other oral infections have been strongly linked with numerous medical problems, such as:

- Heart attacks, atherosclerosis and strokes
- Alzheimer's
- Rheumatoid arthritis
- Diabetes
- Pneumonia
- Premature/low weight births
- Pancreatic, bowel & esophageal cancer

Did You Know That Oral Infections Are Easily Transferable?

When you share a kiss or food with your loved ones, you are also sharing your oral bacteria!

Introducing The OraVital Treatment

The OraVital System fights and controls harmful bacteria, restoring your mouth to a healthy state.

The Oral Infection Experts™

Step 1: Testing

Testing for infection in the mouth is as necessary as the lab tests you have at your doctor's office.

A simple microbiology test shows the precise bacterial causing oral infections to your dentist, making accurate diagnosis and predictable, effective treatment possible. Swab

samples from your gums, teeth and tongue are sent to OraVital's oral microbiology lab for thorough analysis. An oral microbiologist provides a comprehensive report your dentist uses to recommend a personalized treatment and maintenance plan.

Step 2: Treatment

Based on your detailed lab report, your dentist will prescribe an OraVital antibiotic rinse and/or cream medication to help control your infection by killing harmful bacteria and yeast. Your hygienist will explain the personalized home care regimen designed to be most effective for you. A follow up appointment will be scheduled to measure the changes and assess your improved oral health.

Step 3: Regular Checkups Keep You Healthy

When you come in for your regular dental cleaning, it is important for you to be examined for bacterial deposits/biofilm and bleeding as well as having your teeth cleaned. If there are signs of infection, your dentist will recommend additional care that could include retesting. This ensures a sustainable and superior standard of oral care which will keep your mouth and body as healthy as possible. Your personalized regimen of home care and recommended hygiene visits will keep your mouth infection-free.

How Does OraVital Treat Gum Disease?

The OraVital System will:

- Stop bleeding gums and bad breath
- Restore oral health and enhance overall health
- Remove the risk of spreading your infection to your family
- Reduce the risk of heart attack, stroke, diabetes, cancers and pregnancy issues

If you believe you may have an oral infection or you see the signs of gum disease, we advise that you don't put it off any longer. Call us today at 250-941-0488 to set up an appointment so we can help you get started on a path to better oral and overall health!
